

ABSTRACT

A reproducing apparatus comprising: a main body; a frame which can be freely pushed out from, or drawn in the main body; a disk tray which is rotatably attached to the frame, for mounting a plurality of disks; an optical pick-up unit for reproducing recording data recorded in each disk, the disk tray for rotatably moving a designated disk at the optical pick-up unit; and the designated disk being reproduced; wherein the optical pick-up unit operating along with a turn table for holding and rotating the disk, is located between the rotation center of the disk tray and the front panel the main body when the frame is drawn in said main body.
